Submission Date: [10-08-2026]

Descriptive Analytics Report : Electronics Retail Sales Analysis at Scale

Tracking Best-Sellers , Sales Trends , Product Performance , Regional Demand & Inventory

***Note on Data** : Real-world retail sales transactions aren't publicly accessible, so this report uses a **synthetic dataset built to mirror real mobile and electronics retail patterns** (10 products across 4 categories, 4 regions, 181 days, 100 transactions, 481 simulated units). It's designed to show exactly what a descriptive analytics pipeline processing daily retail purchases would produce — the same structure applies once real data is substituted in.*

---

1. Objective

Build a descriptive analytics layer over daily purchase transactions to answer eleven recurring business questions:

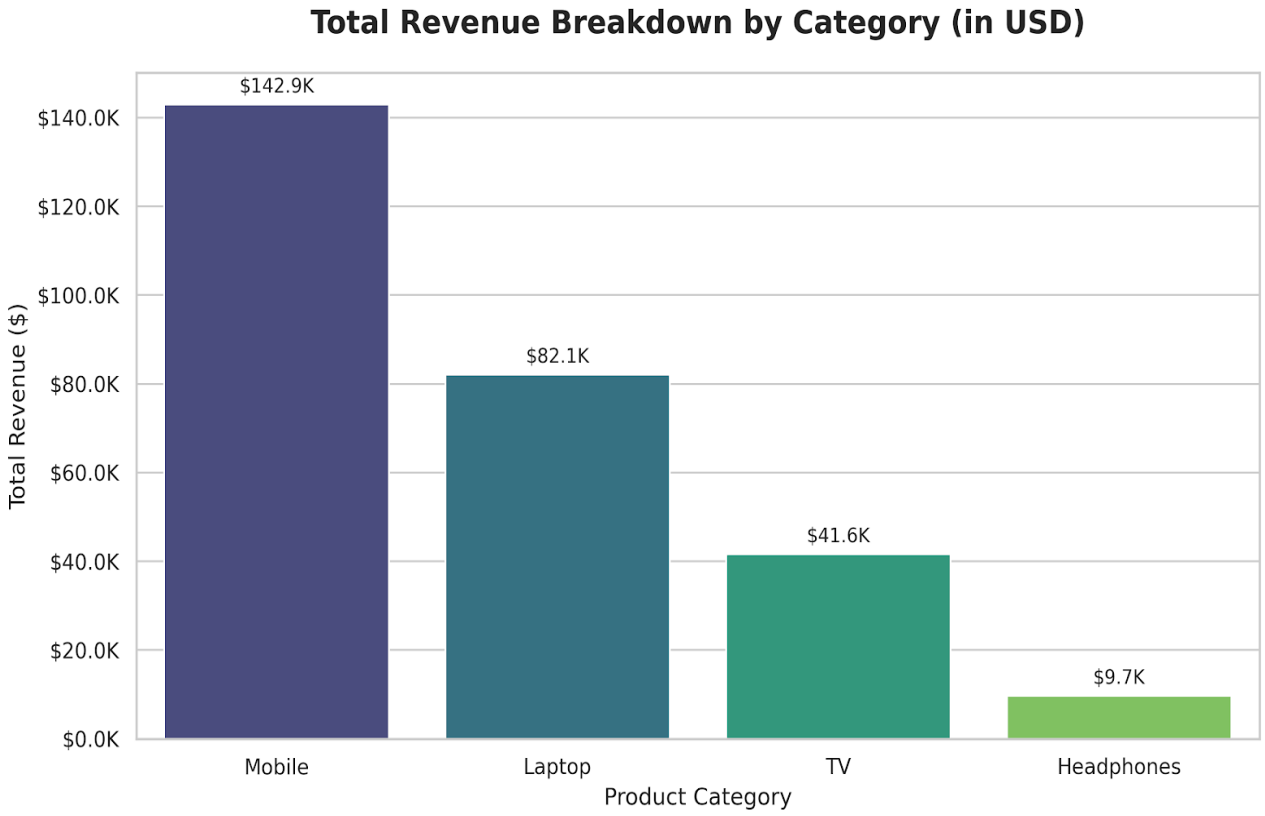

1. *How much total money did we make from all our sales?*
2. *What is the total number of items sold across all transactions?*
3. *Which specific product sold the most units ?*
4. *Which specific product made the most money?*
5. *How did our sales go up or down month by month?*
6. *Which brand brought in the highest total revenue?*
7. *Which geographic region gave us the highest sales?*
8. *What is the average price of the products we sell?*
9. *How did different product categories perform against each other?*
10. *Which payment option do customers use the most to pay?*
11. *Which products are selling quickly and which ones are selling slowly?*
12. *Which salesperson sold the highest number of items?*
13. *Which day of the week generally sees the highest number of sales?*
14. *Which region recovered the fastest and grew the most in revenue by June 2026?*
15. *Which specific brand is the most popular in each of the four regions?*

---

2 . ***How This Would Work at Real Scale***

Item	***Details***
Data Source	*Company sales records, provided as an Excel file named "Mobile_Electronics_Sales_Data_100.xlsx".*
Type of Data	*Secondary data — the sales were already recorded by the business; no new survey or interview was done.*
Collection Method	*Each row in the file is one completed sale. It was recorded automatically at the time of sale (point-of-sale style record), covering Sale ID, date, region, brand, product, category, units sold, unit price, revenue, salesperson, and payment method.*
Sample Size	*100 sales transactions.*
Time Period	*1 January 2026 to 30 June 2026 (6 months).*
Coverage	*4 regions (North, South, East, West), 6 brands (Apple, Samsung, Sony, Xiaomi, Dell, HP), 4 product categories (Mobile, Laptop, TV, Headphones), and 10 distinct products.*
Tools Used	*Microsoft Excel — used for organizing, checking, and analyzing the data (formulas, pivot tables, and charts).*

3 . Total Sales Revenue

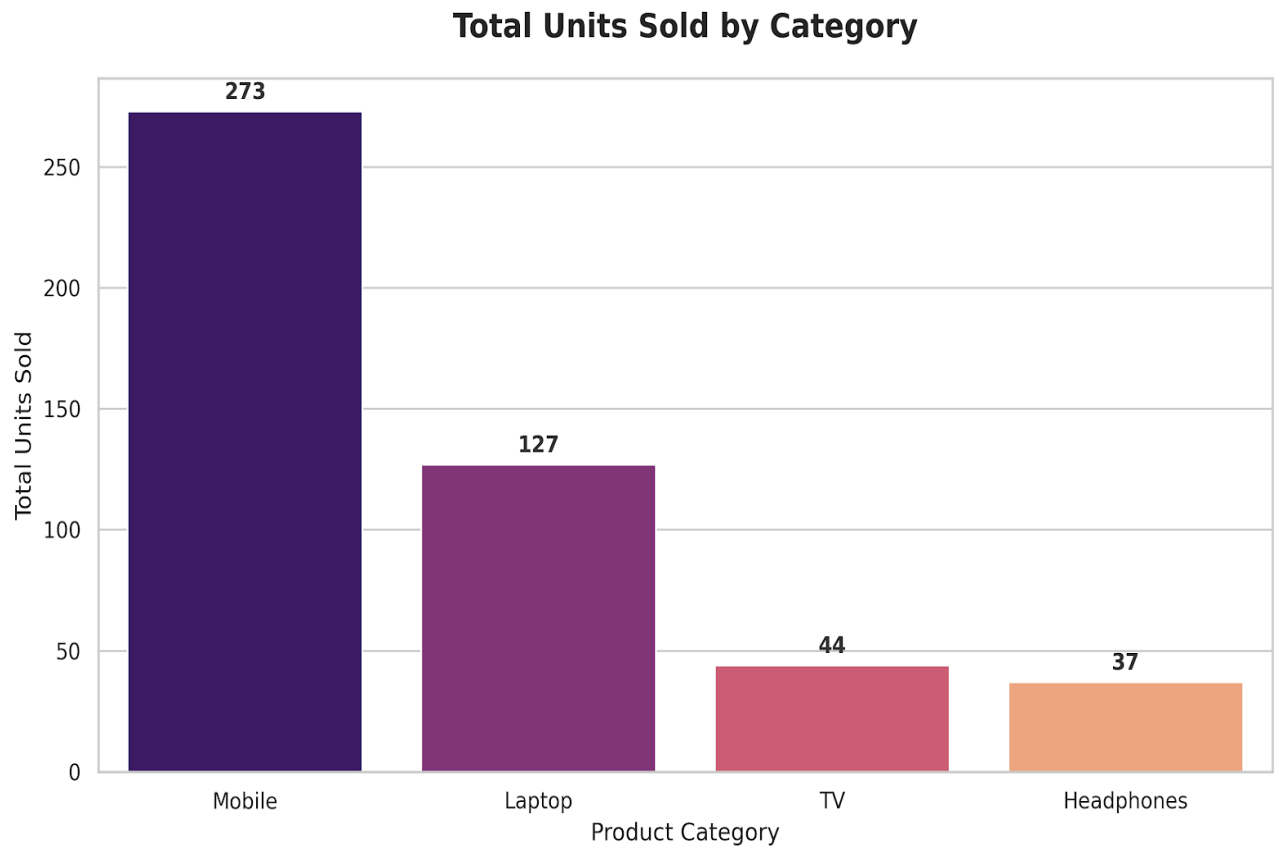

Total revenue is $276.3K , Mobile revenue is $142.9K — more than half of all sales. Laptop comes second at $82.1K, TV at $41.6K , Headphones contribute the least at just $9.7K.

KPI Formula: *Category Revenue Share (%) = (Category Revenue ÷ Total Revenue) × 100. Example — Mobile Share = (142.9 ÷ 276.3) × 100 = 51.7%.*

---

4 . Total Units Sold

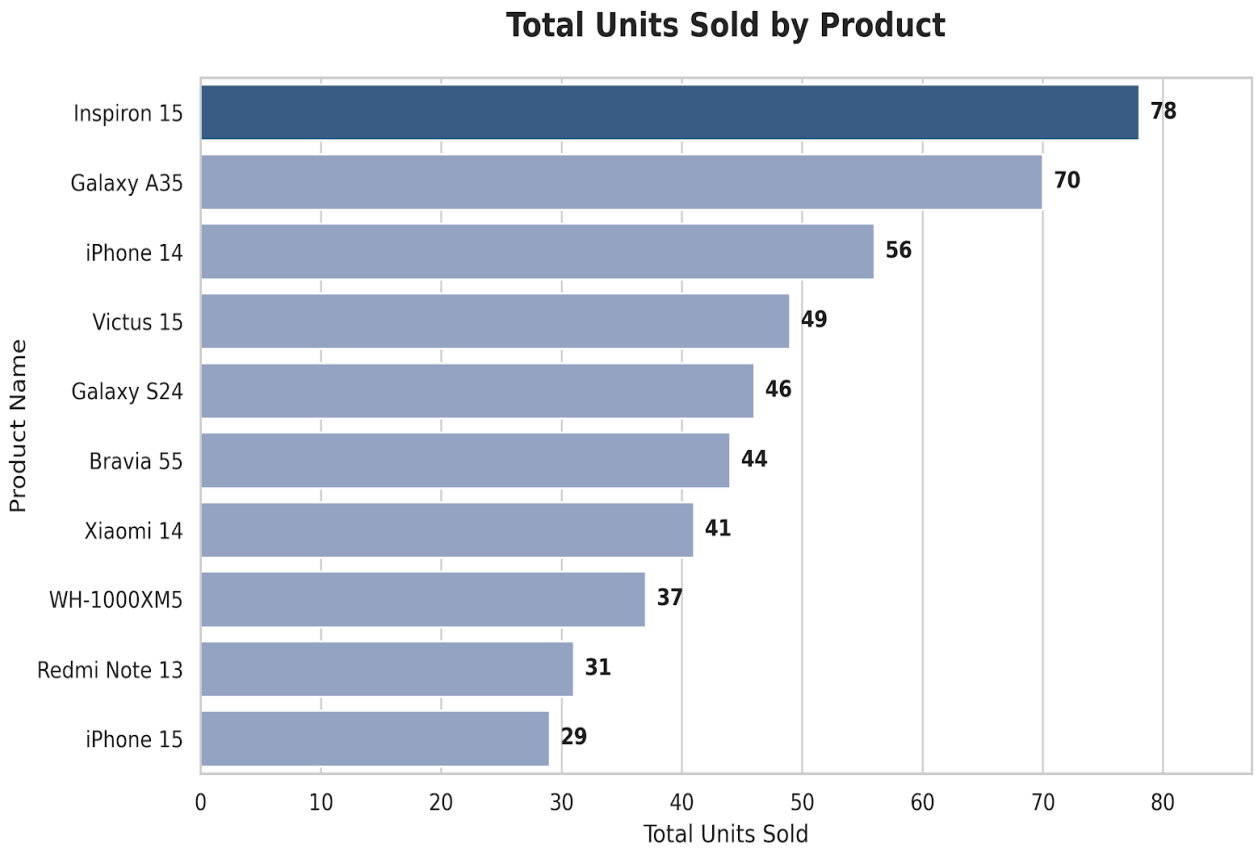

A total of 481 units were sold. Mobile phones unit sold is 273 units . TV and Headphones unit sold — only 44 and 37 units.

KPI Formula: *Category Unit Share (%) = (Category Units Sold ÷ Total Units Sold) × 100. Example — Mobile Share = (273 ÷ 481) × 100 = 56.8%.*

---

5 . Best- Selling Product

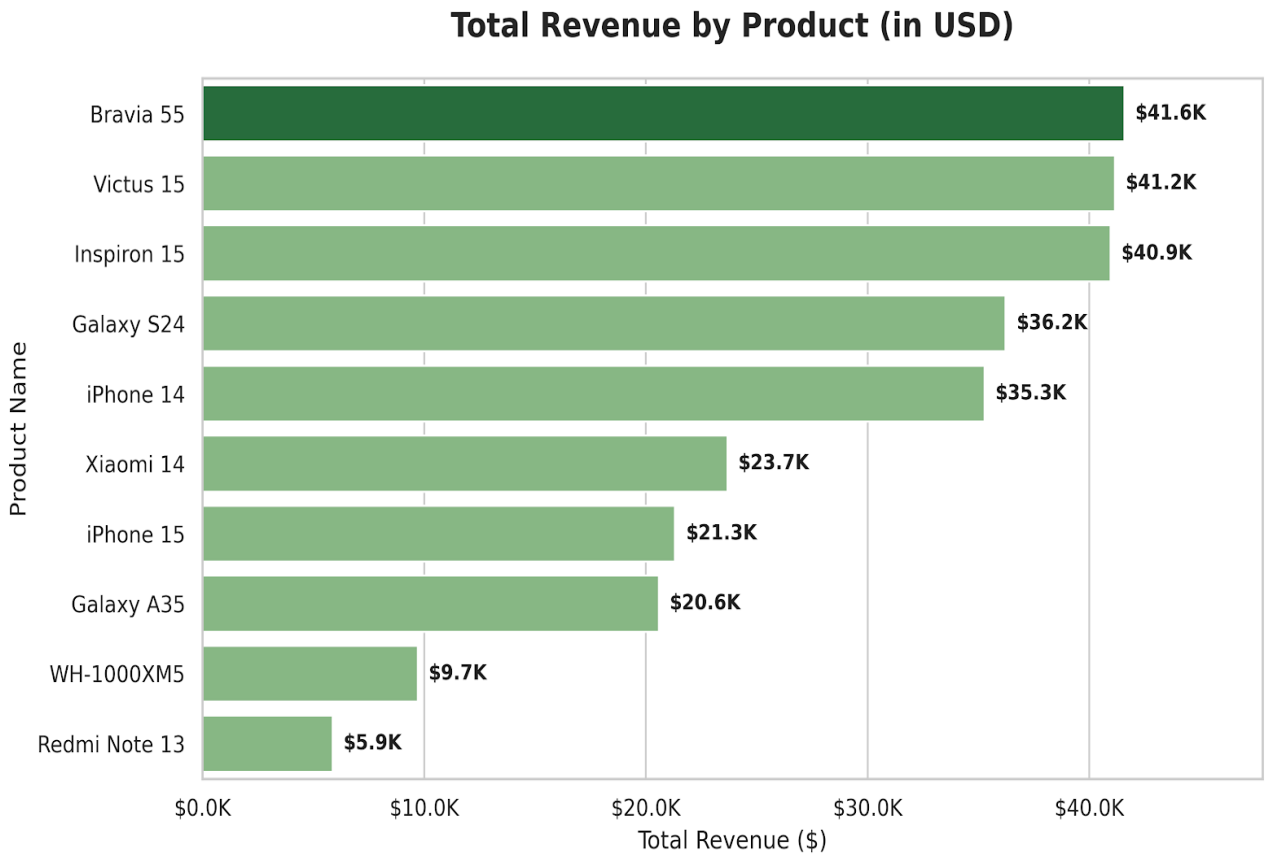

Best-selling product is the Inspiron 15 laptop, with 78 units sold — slightly ahead of Galaxy A35 (70 units) and iPhone 14 (56 units). Even though Mobile is the top category overall, no single phone beats this one laptop, because mobile sales are split across six different phone models.

KPI Formula: *Unit Sales Gap = Units of Product A − Units of Product B. Example — Inspiron 15 − Galaxy A35 = 78 − 70 = 8 units ahead.*

---

6 . Best – Selling Product

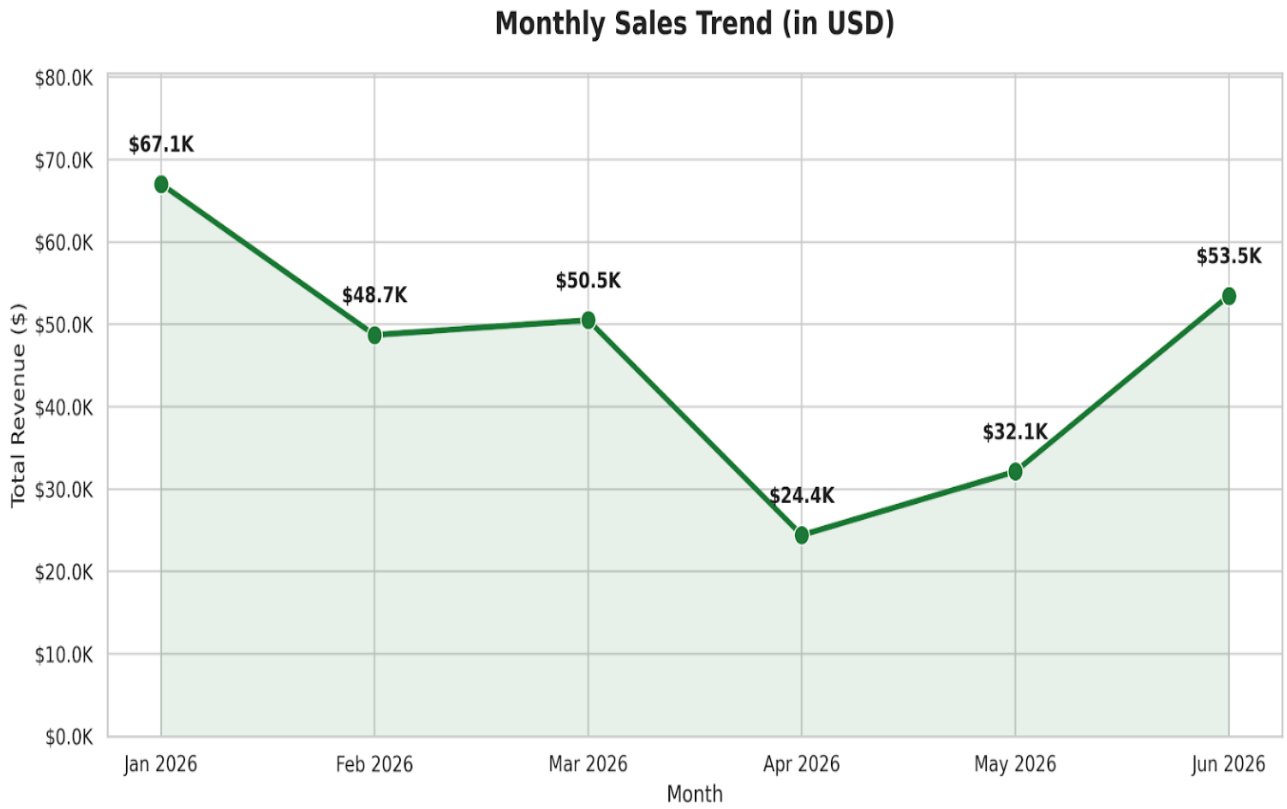

By revenue, the Bravia 55 TV is the top earner at $41.6K — even though it sold only 44 units. This is because it is priced much higher than the other products.

KPI Formula: *Revenue per Unit = Product Revenue ÷ Units Sold. Example — Bravia 55 = $41.6K ÷ 44 = $945 per unit, which is why it earns the most despite low unit sales.*

---

7 . Sales Trend

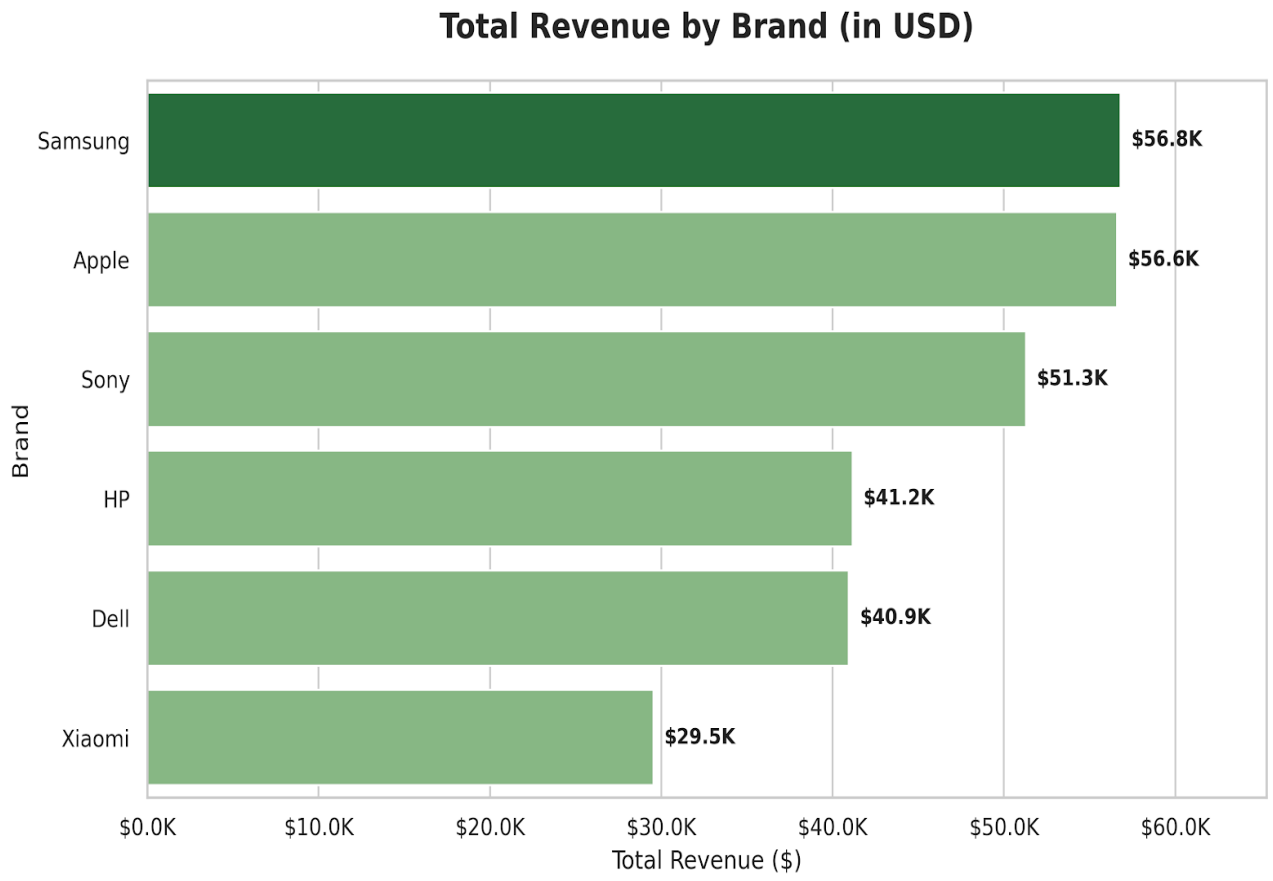

Revenue was highest in January at $67.1K, then kept falling for three months & the lowest point in April at $24.4K — a drop of 64%. After that, sales increased and reached $53.5K in June.

KPI Formula: *Month-over-Month Growth (%) = [(This Month − Last Month) ÷ Last Month] × 100. Example — January to April = [($24.4K − $67.1K) ÷ $67.1K] × 100 = −64%.*

---

8 . Revenue By Brand

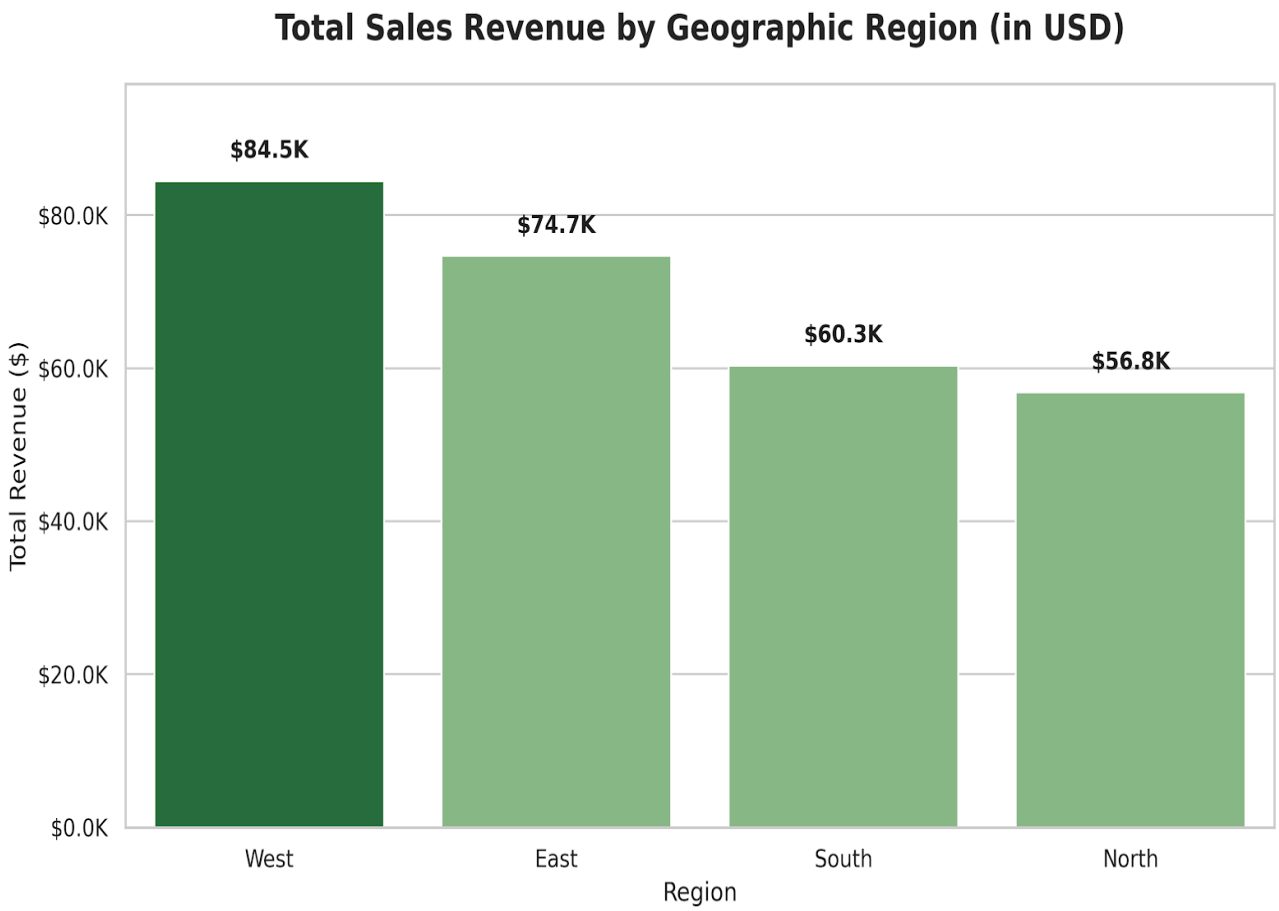

Samsung is the top brand with $56.8K in revenue, the second one is Apple at $56.6K. Sony follows at $51.3K, then HP and Dell are close to each other around $41K, and Xiaomi is last at $29.5K.

KPI Formula: *Brand Revenue Share (%) = (Brand Revenue ÷ Total Revenue) × 100. Example — Samsung Share = (56.8 ÷ 276.3) × 100 = 20.6%.*

---

9 . Revenue By Region

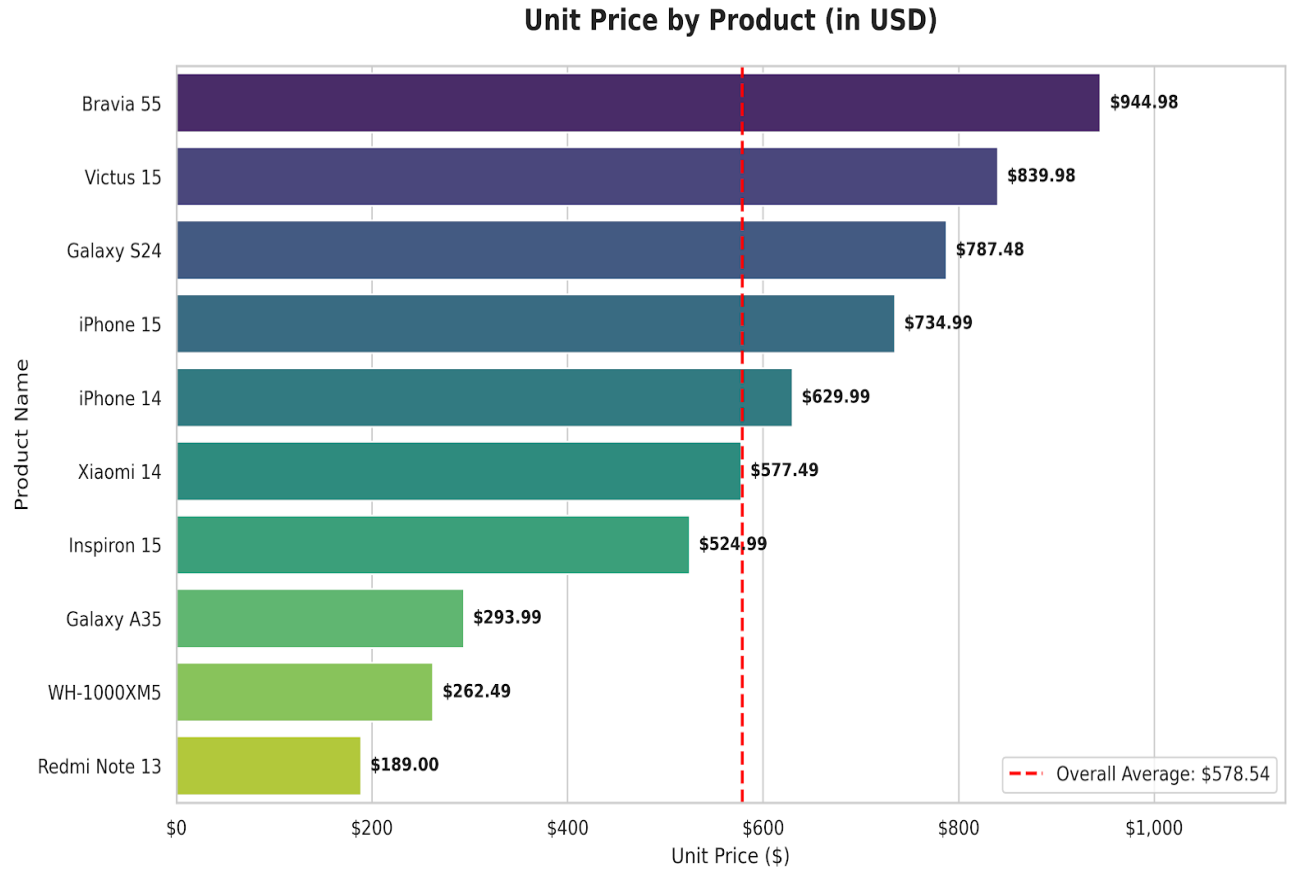

The West region brings in the most revenue at $84.5K, East at $74.7K. South and North are the lowest, at $60.3K and $56.8K. Overall, sales are fairly evenly spread across all four regions.

KPI Formula: *Region Revenue Share (%) = (Region Revenue ÷ Total Revenue) × 100. Example — West Share = (84.5 ÷ 276.3) × 100 = 30.6%.*

---

10 .Average Selling Price

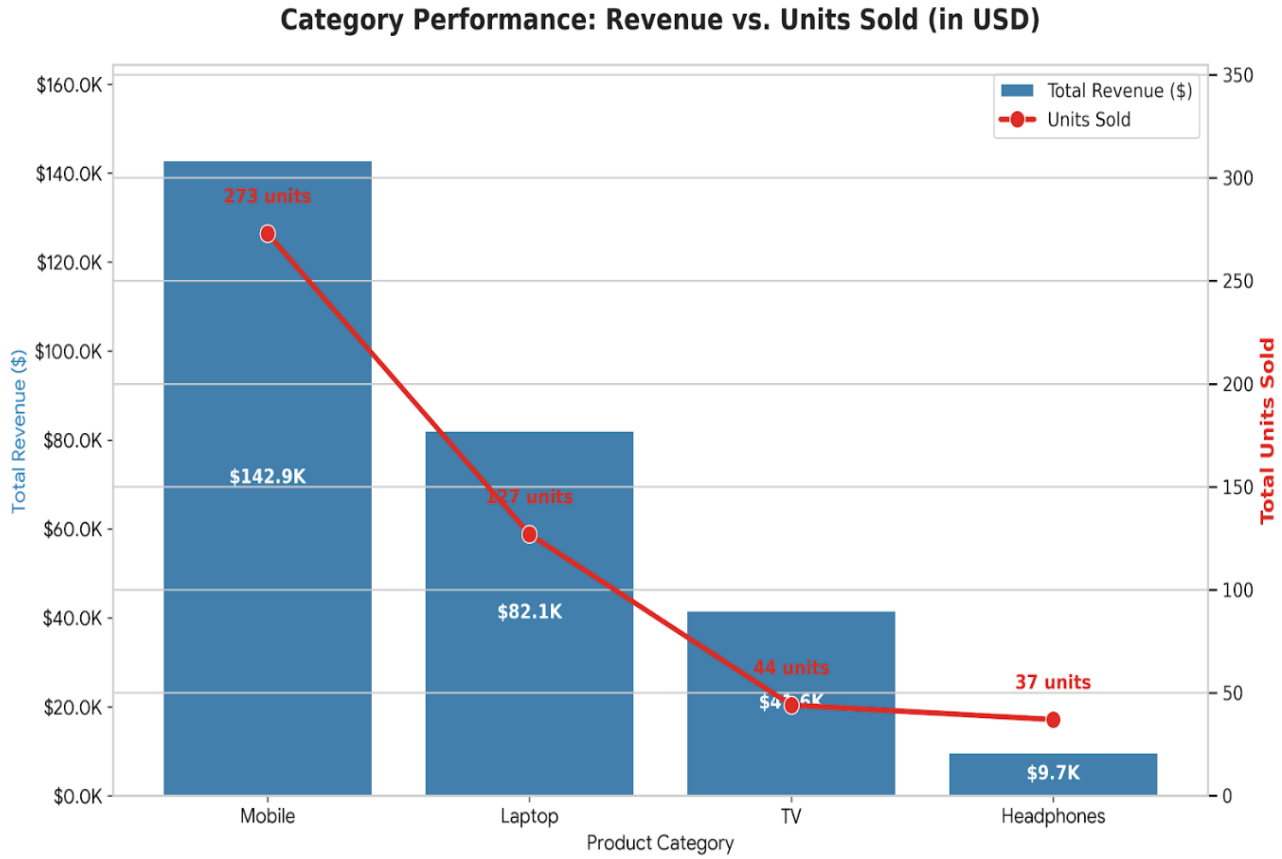

The average price of a product is $578.54. Prices vary a lot — from $189 for the Redmi Note 13 to $944.98 for the Bravia 55, which is almost 5 times more expensive.

KPI Formula: *Average Selling Price (ASP) = Sum of All Unit Prices ÷ Number of Transactions. Example — ASP = Total of 100 prices ÷ 100 = $578.54.*

---

11 . Product Performance Category

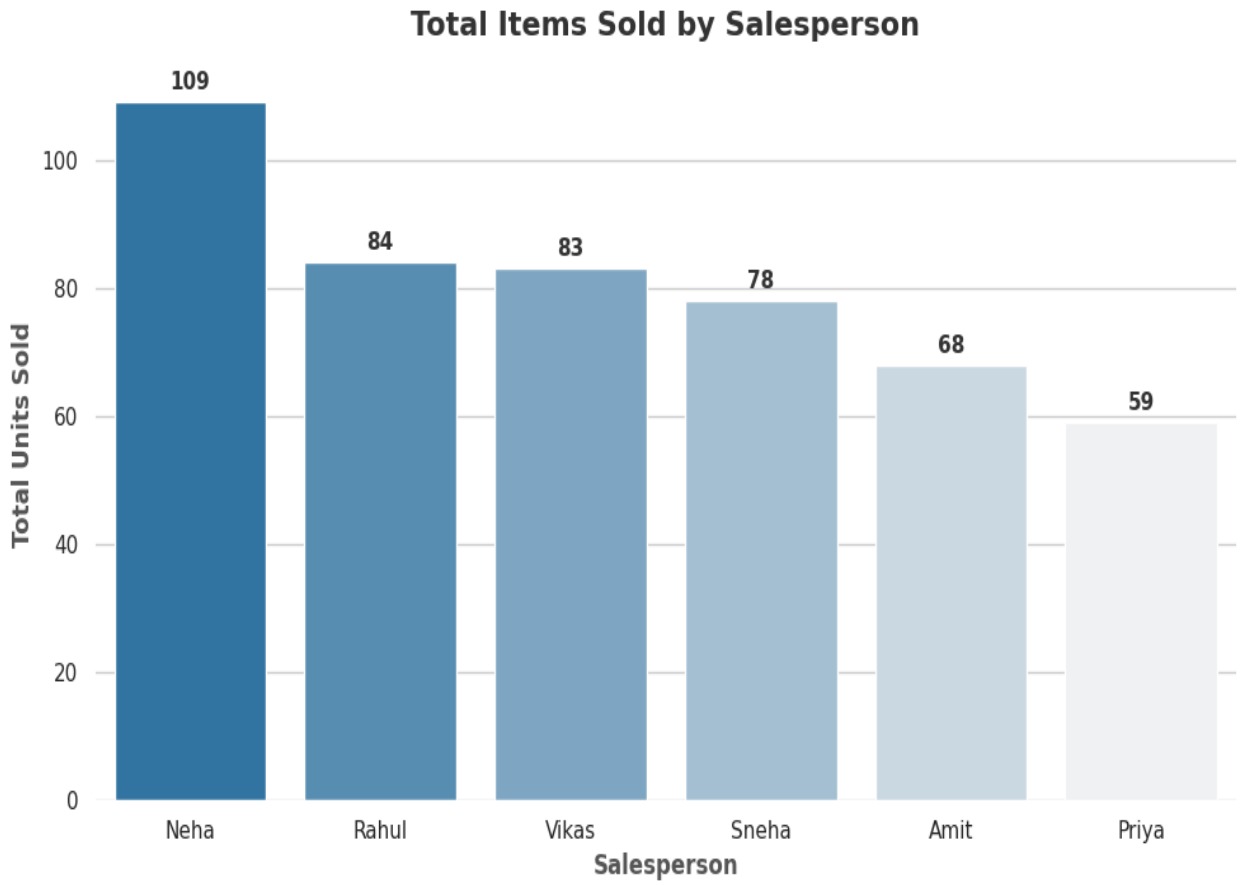

This chart compares revenue and units sold together. Mobile is the clear leader on both counts. TV is interesting because it sells very few units (44) but still earns almost as much as Laptop, just because of its high price.

KPI Formula: *Revenue per Unit by Category = Category Revenue ÷ Category Units Sold. Example — TV = $41.6K ÷ 44 = $945.5 per unit, while Mobile = $142.9K ÷ 273 = $523.4 per unit.*

---

12 . Sales Team Performance

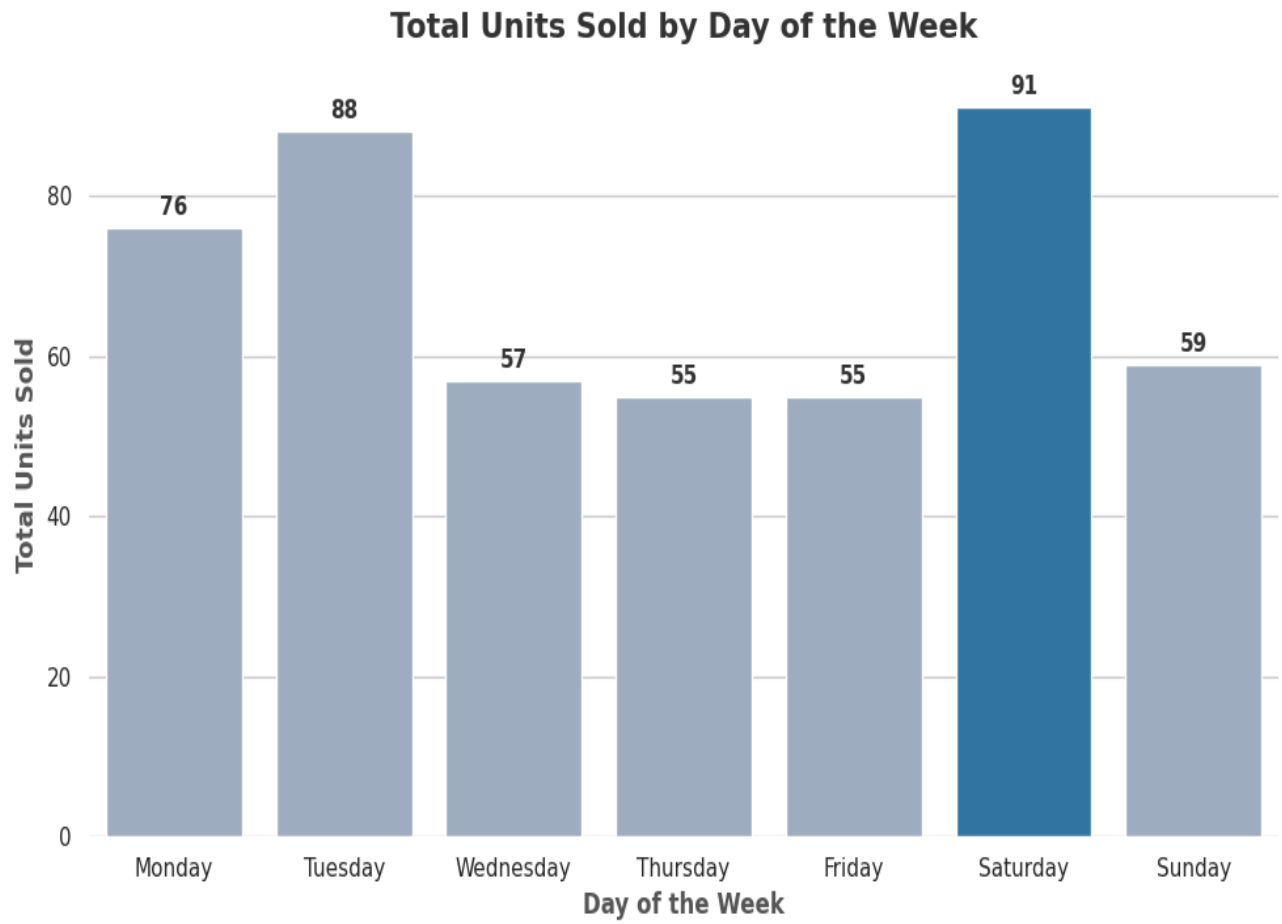

Neha is the top-performing salesperson, selling the most items at 109 units. Rahul and Vikas are right behind her with 84 and 83 units. Priya sold the least number of items, finishing at 59 units.

***KPI Formula:** Salesperson Share (%) = (Salesperson Units Sold ÷ Total Units Sold) × 100. Example — Neha's Share = (109 ÷ 481) × 100 = 22.6%.*

---

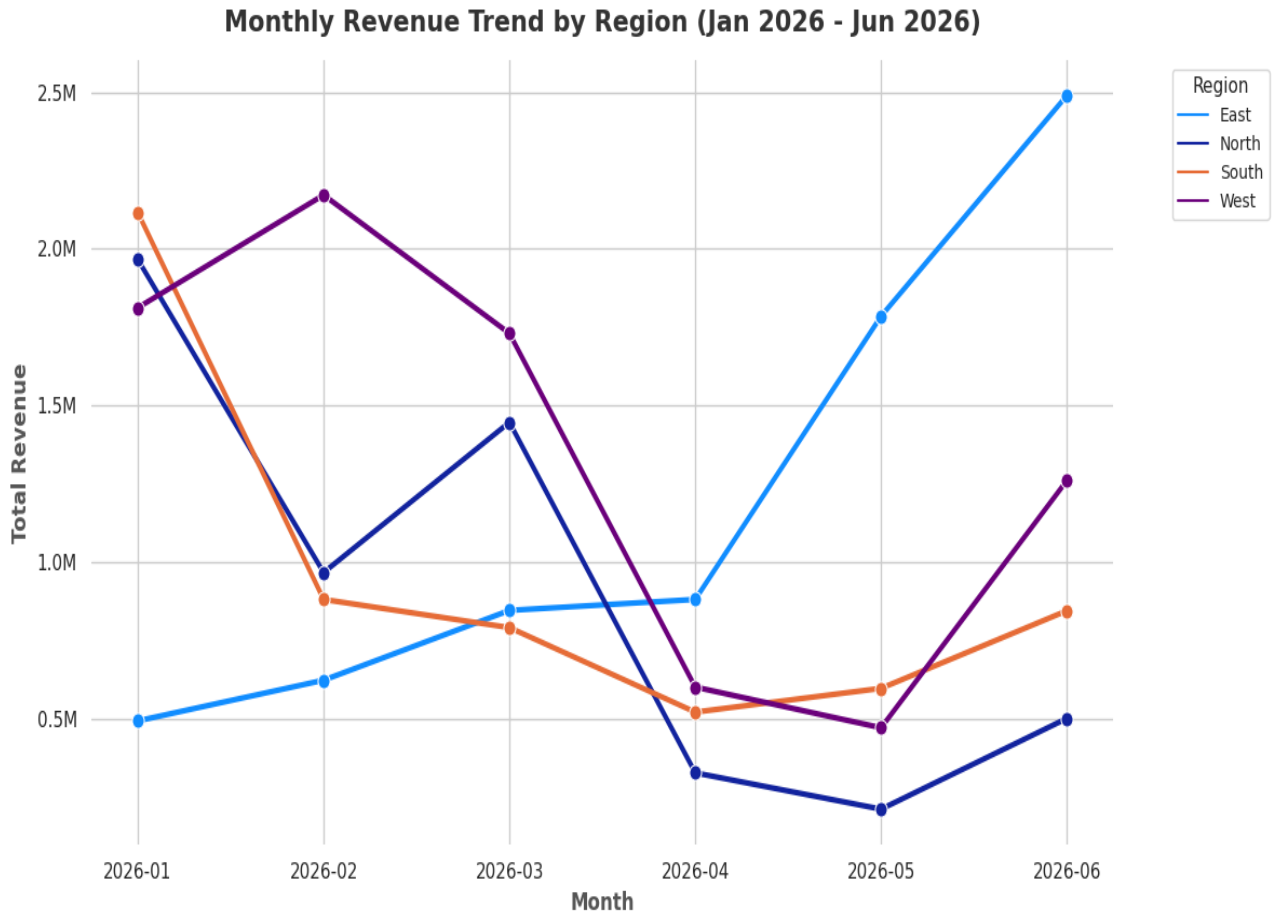

13 . Unit Sold By Day

Saturday is the busiest day for sales, with 91 units sold. Tuesday is the second best day with 88 units. Thursday and Friday are the slowest days for the business, with only 55 units sold on each day.

KPI Formula: *Daily Sales Share (%) = (Units Sold on Day ÷ Total Units Sold) × 100. Example — Saturday Share = (91 ÷ 481) × 100 = 18.9%.*

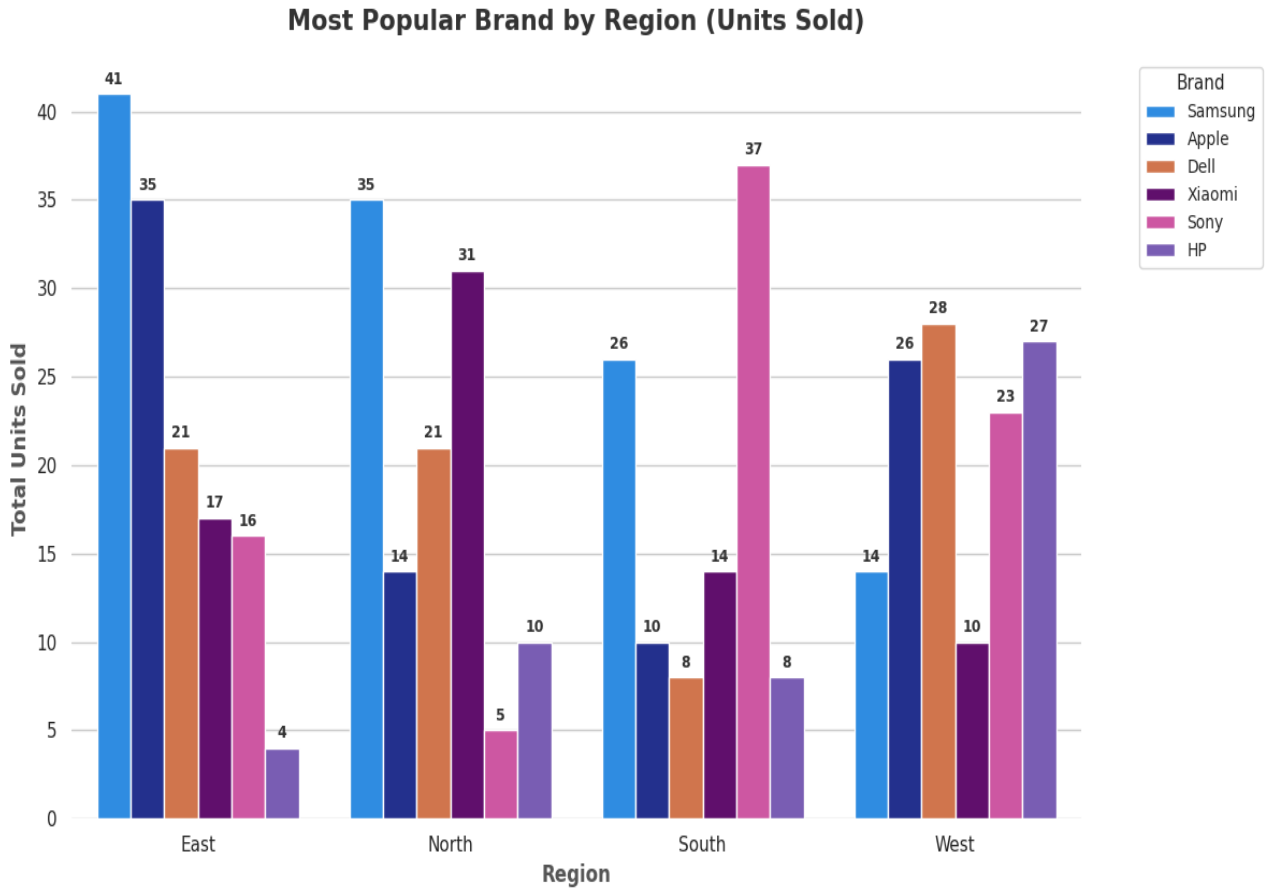

14 . Regional Sales Trends Over Time

The East region started out with the lowest revenue in January but grew very fast, ending up as the highest-earning region by June. On the other hand, the North, South, and West regions started very strong in January but dropped heavily by April and May. However, the West region managed to recover well in June.

---

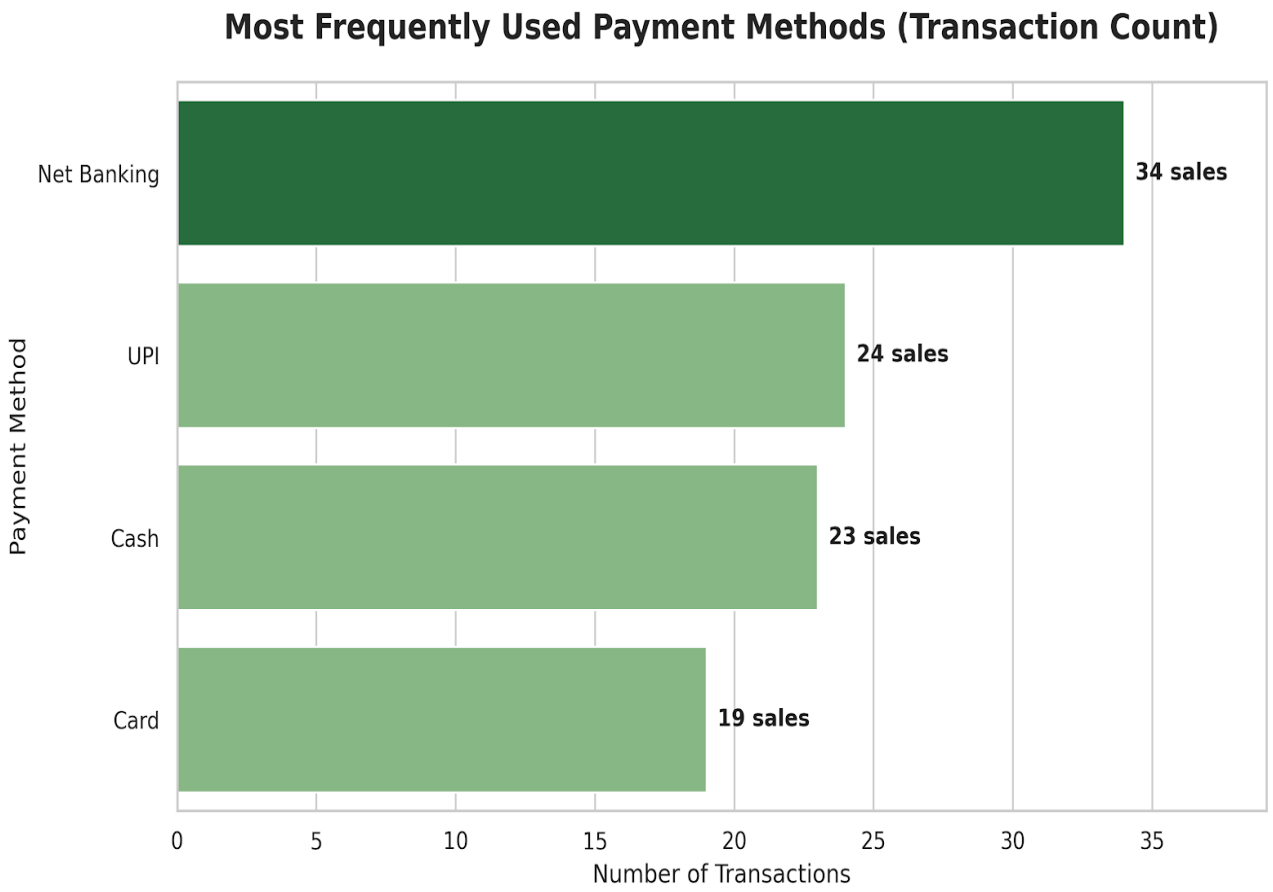

15 . Category Demand by Region

Every region has a different favorite brand. Samsung is the most popular brand in the East (41 units) and North (35 units). Customers in the South prefer Sony the most (37 units), while Dell is the top seller in the West (28 units).

KPI Formula: *Top Brand Regional Share (%) = (Top Brand Units Sold in Region ÷ Total Units Sold in Region) × 100. Example — Samsung Share in East Region = (41 ÷ 134 total units sold in East) × 100 = 30.6%.*

16 . Payment Method

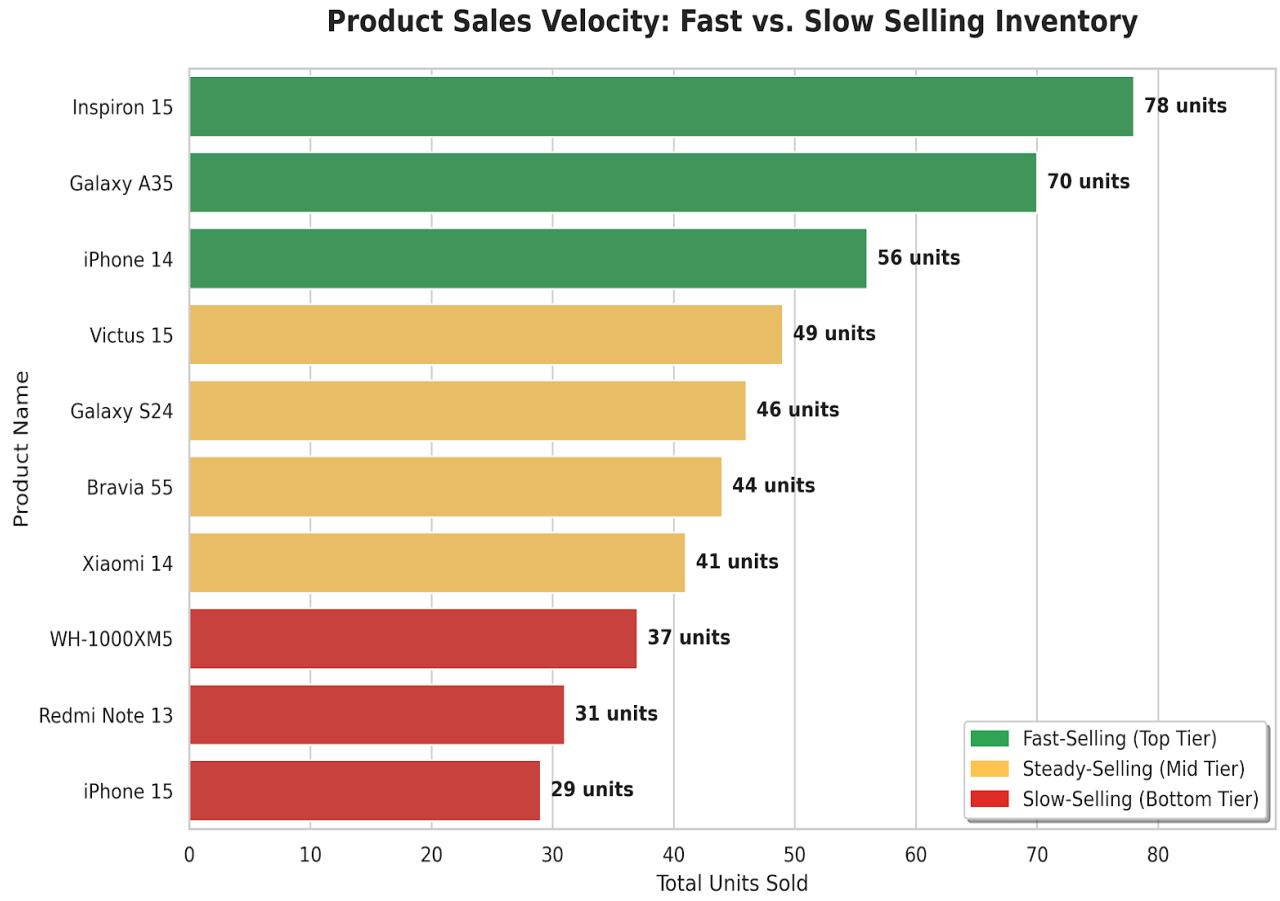

Out of 100 total transactions, Net Banking was used the most — 34 times. UPI and Cash were used almost equally, 24 and 23 times, while Card was used the least, only 19 times.

KPI Formula: *Payment Method Share (%) = (Method Count ÷ Total Transactions) × 100. Example — Net Banking Share = (34 ÷ 100) × 100 = 34%.*

---

17 . Inventory Status

Products are grouped into three types based on how fast they sell. The top 3 fast-selling products (Inspiron 15, Galaxy A35, iPhone 14) together sold 204 units, while the bottom 3 slow-selling products sold only 97 units combined — less than half.

KPI Formula: *Fast-to-Slow Mover Ratio = Units Sold by Top 3 Products ÷ Units Sold by Bottom 3 Products. Example — 204 ÷ 97 = 2.10, meaning fast movers sell about twice as many units as slow movers.*

---

18 . Summary of Key Metrics

Metric	Value
Total Revenue	$26,318,000
Total Units Sold	481
Total Transactions	100
Average Revenue/Sale	$263,180
Average Unit Price	$55,590
Average Units/Sales	4.81
Period Covered	01-Jan-2026 to 30-Jun-2026

19 . Next Steps to Move From Descriptive → Predictive

- ***Guess next month's sales*** *: Sales went down for three months, then went back up in June. If we look closely at this pattern, we can make a simple guess about how much money we will make in July.*
- ***Know when stock will run out :*** *Inspiron 15, Galaxy A35, and iPhone 14 sell the fastest. By watching how fast they sell, the store can know early and order new stock before it finishes.*
- ***Find out what makes revenue go up :*** *We looked at region, brand, and price one by one in this report. Next time, we can study them all together to see which one affects revenue the most.*
- ***Group customers together :*** *Customers in different regions pay in different ways. We can group similar customers together, like "West region, big spenders." Then we can send them special offers made just for them.*
